

FWA AI LAUNCHPAD — HACKATHON SUBMISSION

CoFoundry

A searchable, categorized directory of every project the cohort has built — so classmates can find each other's work and find collaborators.

Mansi Modi · Sri Annamraju

July 10, 2026

Built with Claude + n8n · hosted on Vercel

WHY

Finding a classmate's project shouldn't mean scrolling one post at a time.

Microsoft Teams (free tier) has no admin export, no API access, and no way to browse “all submissions” as a set — just a long, un-filterable scroll. Finding a specific project, or finding everyone working on something similar to your own idea, meant opening post after post by hand.

“It’s tiresome, and it’s not the most efficient way to see each other’s projects.”

— the problem CoFoundry sets out to fix

WHAT IT DOES

One directory. Three ways to find what you're looking for.

1

Browse by category

All 97 projects sorted into 16 topic areas — Business & Analytics, Healthcare & Medical, Career & Job Search, and more.

2

Authors & collaboration

See every author, how many projects they've built, and which categories they span — with a “Cross-domain builder” badge to spot potential teammates fast.

3

Ask CoFoundry

A natural-language search box backed by an n8n workflow — ask “who's building something with LangChain?” instead of filtering manually.

BY THE NUMBERS

97 projects, sorted so they're actually usable.

97

PROJECTS CAPTURED

53

AUTHORS

16

CATEGORIES

96/97

LINKED TO ORIGINAL POST

WHO

Built for the cohort, by two of its own.

WHO IT'S FOR

Cohort members — the 53 authors and everyone else in the course, to find what classmates built and who to team up with.

Course organizers (FWA / World Alliance) — a zero-cost way to see the full body of work from a cohort without needing Teams admin access.

WHO BUILT IT

Mansi Modi & Sri Annamraju

Extraction, categorization, and the frontend built with **Claude**.
Natural-language search backend built with **n8n**.

WHERE IT LIVES

No API access, so we built around it.

The directory itself is a single self-contained HTML page — no build step, no backend to maintain beyond the n8n search workflow.

UNDER THE HOOD

Two n8n workflows: one loads data, one answers questions.

1 • DATA LOADING WORKFLOW — run manually whenever new submissions come in

2 • QUERY WORKFLOW — fires on every Ask CoFoundry search

Both workflows share one data table, so the site you browse and the answers Ask CoFoundry gives always come from the same source of truth.

What broke while we built it.

1

Scraping Teams took real trial and error

Getting clean, accurate data out of Teams took 3-5 full reruns — each one taking hours and burning significant tokens — before the extraction was reliable.

2

Stale cache from the Get Rows node

After updating the data table, the Get Rows node kept returning old data. Fixed by deleting and recreating both the data table and the node itself.

THE RESULT

A working end-to-end pipeline that lets anyone query finished hackathon projects using natural language.

What made this hard — and what it cost us.

1

Free-tier Teams navigation

No export or API meant every post had to be opened and parsed individually through browser automation — this repeatedly hit runtime errors and required multiple recovery passes to get from 0 to 96 of 97 Teams links captured.

2

Attachment-only posts

16 of the 97 submissions leaned on a screenshot or attached file for the real explanation, with little inline text — these are flagged separately since an automated read of them is less reliable.

3

Missing / unverified data as a result

One project has no recoverable Teams link after two search attempts. A follow-up link audit also found a few project demo links that were dead, pointed to the wrong app, or duplicated across two unrelated projects.

NEXT STEPS

Real-time classification needs one thing: admin access.

To make this seamless going forward — and to classify new projects in real time instead of through periodic manual extraction — the next step is admin rights to the Teams channel (or moving off the free tier). That unlocks the Graph API, so extraction and categorization can run automatically instead of through browser automation.

This is a natural next step for Future World Alliance to take on, if there's appetite to keep CoFoundry running beyond one cohort.

Thank you.
